

FYI...the following message is being distributed at the request of the Department of the Army:

Subject: Situational Awareness: Google Play App (CAC Scan)

Importance: High Description: An Application named CAC Scan has been released and is available in the Google Play store.

Details: Android App is designed to scan the bar code on the front of a Military CAC. **Impact:** CAC Scan is an Android application that scans the barcode on a CAC card and decodes that information. The information that the App is able to retrieve from the CAC card includes the ID type, social security number, EDIPI, first name, last name, middle initial, and rank. According to the google play store this application has been downloaded 100-500 times and was last updated on April 20th, 2016.

UPDATE: The Army Counter-Intel folks are working with the creators to remove the application.

Interim Solution: Do not download and do not use this application. Ensure that your CAC is with at all times and stored in a secured location when not in use.
Respectfully,

CPT Juan Pratts
